

# Propositional Logic Equivalences

# Equivalence

## Definition (Equivalence)

Two formulas  $F$  and  $G$  are (semantically) equivalent if  $\mathcal{A}(F) = \mathcal{A}(G)$  for every assignment  $\mathcal{A}$  that is suitable for both  $F$  and  $G$ .

We write  $F \equiv G$  to denote that  $F$  and  $G$  are equivalent.

## Exercise

Which of the following equivalences hold?

$$(A \wedge (A \vee B)) \equiv A$$

$$(A \wedge (B \vee C)) \equiv ((A \wedge B) \vee C)$$

$$(A \rightarrow (B \rightarrow C)) \equiv ((A \rightarrow B) \rightarrow C)$$

$$(A \rightarrow (B \rightarrow C)) \equiv ((A \wedge B) \rightarrow C)$$

# Observation

The following connections hold:

$$\begin{aligned} \models (F \rightarrow G) & \text{ if and only if } F \models G \\ \models (F \leftrightarrow G) & \text{ if and only if } F \equiv G \end{aligned}$$

# Reductions between problems (I)

- ▶ **Validity** to **Unsatisfiability** (and back):

$$\begin{aligned} F \text{ valid} & \text{ iff } \neg F \text{ unsatisfiable} \\ F \text{ unsatisfiable} & \text{ iff } \neg F \text{ valid} \end{aligned}$$

- ▶ **Validity** to **Consequence**:

$$F \text{ valid} \quad \text{iff} \quad \top \models F$$

- ▶ **Consequence** to **Validity**:

$$F \models G \quad \text{iff} \quad F \rightarrow G \text{ valid}$$

## Reductions between problems (II)

- ▶ **Validity** to **Equivalence**:

$$F \text{ valid} \quad \text{iff} \quad F \equiv \top$$

- ▶ **Equivalence** to **Validity**:

$$F \equiv G \quad \text{iff} \quad F \leftrightarrow G \text{ valid}$$

# Properties of semantic equivalence

- ▶ Semantic equivalence is an **equivalence relation** between formulas.
- ▶ Semantic equivalence is **closed under operators**:

If  $F_1 \equiv F_2$  and  $G_1 \equiv G_2$   
then  $(F_1 \wedge G_1) \equiv (F_2 \wedge G_2)$ ,  
 $(F_1 \vee G_1) \equiv (F_2 \vee G_2)$  and  
 $\neg F_1 \equiv \neg F_2$

Equivalence relation + Closure under Operations  
=  
**Congruence relation**

# Replacement theorem

## Theorem

*Let  $F \equiv G$ . Let  $H$  be a formula with an occurrence of  $F$  as a subformula. Then  $H \equiv H'$ , where  $H'$  is the result of replacing an arbitrary occurrence of  $F$  in  $H$  by  $G$ .*

**Proof** by induction on the structure of  $H$ .

# Equivalences (I)

## Theorem

$$\begin{aligned}(F \wedge F) &\equiv F \\ (F \vee F) &\equiv F\end{aligned}\quad (\text{Idempotence})$$

$$\begin{aligned}(F \wedge G) &\equiv (G \wedge F) \\ (F \vee G) &\equiv (G \vee F)\end{aligned}\quad (\text{Commutativity})$$

$$\begin{aligned}((F \wedge G) \wedge H) &\equiv (F \wedge (G \wedge H)) \\ ((F \vee G) \vee H) &\equiv (F \vee (G \vee H))\end{aligned}\quad (\text{Associativity})$$

$$\begin{aligned}(F \wedge (F \vee G)) &\equiv F \\ (F \vee (F \wedge G)) &\equiv F\end{aligned}\quad (\text{Absorption})$$

## Equivalences (II)

$$(F \wedge (G \vee H)) \equiv ((F \wedge G) \vee (F \wedge H))$$

$$(F \vee (G \wedge H)) \equiv ((F \vee G) \wedge (F \vee H))$$

(Distributivity)

$$\neg\neg F \equiv F$$

(Double negation)

$$\neg(F \wedge G) \equiv (\neg F \vee \neg G)$$

$$\neg(F \vee G) \equiv (\neg F \wedge \neg G)$$

(deMorgan's Laws)

$$\neg\top \equiv \perp$$

$$\neg\perp \equiv \top$$

$$(\top \vee G) \equiv \top$$

$$(\top \wedge G) \equiv G$$

$$(\perp \vee G) \equiv G$$

$$(\perp \wedge G) \equiv \perp$$

## Warning

The symbols  $\models$  and  $\equiv$  are **not** operators  
in the language of propositional logic  
but part of the meta-language for talking about logic.

Examples:

$\mathcal{A} \models F$  and  $F \equiv G$  are not propositional formulas.  
 $(\mathcal{A} \models F) \equiv G$  and  $(F \equiv G) \leftrightarrow (G \equiv F)$  are nonsense.

# Parentheses

Precedence of logical operators in decreasing order:

$$\neg \quad \wedge \quad \vee \quad \rightarrow \quad \leftrightarrow$$

Operators with higher precedence bind more strongly.

## Example

Instead of  $(A \rightarrow ((B \wedge \neg(C \vee D)) \vee E))$

we can write  $A \rightarrow B \wedge \neg(C \vee D) \vee E$ .

Well chosen parentheses can improve readability!
